

THE COMPANION TO HOW TO LOSE FAT AS FAST AS POSSIBLE

THE BOY KIBBLE KIT

Eat the same things every day. Track in 90 seconds. Never wonder what's for dinner again.

Chapter 3 gave you the biggest cheat code in the game: eat the same things every day and tracking becomes one tap. This kit is that cheat code, done for you. Your two tools, your ingredient menus with the numbers already looked up, and the formula to build your daily kibble in five minutes.

By Képler Siguineau

PART 1

The Two Tools

Before the food, the hardware. Two purchases, both cheap, both mandatory. If you skip these, you're guessing, and guessing is the four years I wasted.

The Food Scale

Any digital kitchen scale with these three things: reads in **grams**, has a **tare button** (zeroes out the plate so you weigh only the food), and holds at least **5 kg**. That's it. No brand matters, no app connection needed. Typically \$10 to \$15 anywhere that sells kitchen stuff.

How to use it: plate on scale, hit tare, add food, read grams, log it. The scale turns every number in this kit from an estimate into a fact.

The Raw Rule

Everything that CAN be weighed raw gets weighed raw. Cooking changes weight: rice and pasta soak up water, meat loses it, and how much depends on how you cooked it that day. Raw weight is the same every time, so raw is the accurate number. Weigh the rice dry, the chicken before the pan, the potato before the oven, then cook and eat.

Already have cooked parts of your kibble? That's fine, use the cooked entries in these menus and log it that way. What is never fine is skipping the scale. Raw when you can, cooked when you must, measured ALWAYS. Nothing touches the plate unweighed.

The Body Scale

Any digital bathroom scale. Consistency beats features: same scale, same floor spot, every morning after the bathroom, before food or water. A basic one runs about \$20. The fancy body fat readouts on smart scales are unreliable, so if yours shows one, ignore it and use the mirror chart from Chapter 2 instead. The weight number is the one that matters, and only its 7 day average at that.

PART 2

The Ingredient Menus

Four menus: protein, carbs, veggies, fats. Pick from each, weigh, log. Numbers are per 100 grams unless marked, pulled from standard nutrition data. Your package label wins any disagreement, always.

Protein Menu (build every meal around one of these)

Protein	Calories	Protein (g)	Notes
Chicken breast (raw)	120	22	The king. Cheap, lean, takes any seasoning
Lean ground beef 93/7 (raw)	152	21	For when chicken fatigue hits
Shrimp (raw, peeled)	85	20	Highest protein per calorie on the menu
White fish like tilapia (raw)	96	20	Cooks in 10 minutes
Canned tuna in water (drained)	116	26	Zero cooking
Eggs (per large egg)	72	6	Counts toward fats too
Egg whites (per 100g)	52	11	Volume eating
Nonfat Greek yogurt	59	10	Dessert base
Whey protein (per scoop, ~30g)	120	24	The gap filler

Your protein target from Chapter 3: 0.8 to 1 gram per pound of goal weight, every day. Hit it first, fill in the rest after.

Carb Menu (energy, portioned by your remaining calories)

Carb	Calories	Notes
White rice (dry)	365	Weigh DRY before cooking. Already cooked: ~130 per 100g
Potato (raw)	77	Weigh raw. Most filling carb per calorie there is
Sweet potato (raw)	86	Weigh raw. Same deal, different flavor
Oats (dry)	379	Weigh dry. Breakfast workhorse
Pasta (dry)	371	Weigh DRY. Already cooked: ~158 per 100g
Beans, black or pinto (cooked)	127	Carbs plus bonus protein and fiber

Carb	Calories	Notes
Bread (per slice)	75	Check your label, slices vary
Fruit: apple or banana (per piece)	95 / 105	Snacks and sweet cravings

Veggie Menu (volume, near free)

Veggie	Calories	Notes
Broccoli	34	Fills the plate
Green beans	31	Steam bags exist for a reason
Bell peppers	26	Raw with meals
Zucchini	17	Roasts great
Spinach	23	Disappears into everything
Cucumber	15	Crunch for nearly nothing
Lettuce and leafy greens	15	Unlimited salad base

These are so cheap calorically that they're your hunger weapon: when you want to eat MORE food, this menu is where more comes from. Log them anyway. Everything gets logged.

Fat Menu (small amounts, weighed, never eyeballed)

Fat	Calories	Notes
Olive oil (per tablespoon, 14g)	120	The #1 hidden calorie in cooking. Weigh it or spray it
Butter (per tablespoon)	102	Same warning
Peanut butter (per 100g)	588	A spoon is never one serving. Scale, always
Avocado (per 100g)	160	Half an avocado is ~120 cal
Almonds and nuts (per 100g)	579	Pre portion into bags or they disappear
Cheese (per 100g)	~400	Check your label

Fats aren't the enemy. Unweighed fats are. Every entry on this menu is dense enough to erase a workout in three careless bites, and completely fine when it's on the scale first.

PART 3

Build Your Daily Boy Kibble

Five minutes, once. Then you eat it on repeat and tracking becomes a single tap.

Step 1. Take your daily calorie target from Chapter 2 and your protein target from Chapter 3.

Step 2. Pick 1 or 2 proteins from the menu and portion them to hit your protein number. That claims its calories first.

Step 3. Add veggies generously. They barely dent the budget.

Step 4. Spend whatever calories remain on carbs and one weighed fat.

Step 5. Log the whole day ONCE in your tracker and save it as a meal or a day. From now on, eating on plan is one tap, and any swap is just trading an item from one menu for another at the same weight class.

Example: 1,800 Calorie Day, 150g Protein

Meal	The Kibble	Calories	Protein
Breakfast	80g oats (dry) + 1 scoop whey + a banana	528	30g
Lunch	250g chicken breast (raw) + 90g rice (dry) + broccoli	662	58g
Dinner	200g shrimp (raw) + 400g potato (raw) + zucchini + 10g olive oil	639	44g
Snack	170g nonfat Greek yogurt	100	17g
TOTAL		1,929 → trim rice/oats to land 1,800	149g

Don't copy this example. Build YOURS from foods you actually like, because the entire power of the kibble is that you'll happily eat it for 90 days straight. Boring that you enjoy beats exciting that you quit.

That's the kit. Two tools, four menus, one formula. Nothing left to figure out at 6pm ever again. Back to the program.
