

THE 60 DAY PROGRAM

HOW TO LOSE FAT AS FAST AS POSSIBLE

Track your calories. Walk your steps. Lift three days.
Lose 10 pounds in 60 days or get **DOUBLE** your money back.

By Képler Siguineau

Before we start

This book shares my personal experience and education for general information. It is not medical advice, and I am not a doctor, dietitian, or therapist. Consult a qualified physician before beginning this or any diet or exercise program, especially if you have any medical condition, take any medication, are under 18, or are pregnant or nursing. This program is designed for adults. Never eat below the intake floors stated in Chapter 2. If you have a history of disordered eating, work with a professional instead of following this program. By using this book you accept full responsibility for your own health decisions.

READ THIS FIRST

Read This First: The Deal

Before my story. Before the math. Before anything. You need to know the deal you just bought into.

Follow this program for 60 days. If you don't lose at least 10 pounds, I pay you back DOUBLE what you paid for this book.

For that to be possible, this program runs on one thing: **consistency of tracking**. Every day, you'll log what you eat, photograph what you eat, log your steps, and log your morning weight. That's the whole price of admission. It's also, not coincidentally, the exact thing that makes the fat come off. The proof and the results are the same actions.

Here's what to do right now:

1. Read this book today. It's short on purpose.
2. Run your numbers in Chapter 2. Ten minutes with a calculator.
3. Send your Day 1 email (Chapter 7 shows you exactly what goes in it). Your 60 days and your guarantee start the moment you send it.

The people who register Day 1 finish. The people who "start Monday" are still saying it next year. You paid for this. Start the clock.

Full guarantee terms are in Chapter 7. Everything between here and there exists to make sure I never have to pay you.

Let's go.

Chapter 1: There Are No Before Pictures

Every fitness program shows you a before picture.

I can't. Because none exist.

I grew up skinny fat. I can't remember a single time in my childhood when I was lean. I had boobs. In clothes, I could hide them. That was the one advantage I had, and I used it every single day. I wore sweaters even in the summer.

The pool and the beach? I avoided them completely, even though I wanted to go. I was not going to let people see my boobs, and I couldn't just keep a shirt on in the water either. A regular fat person keeps his shirt on and everyone understands why. A skinny fat person keeps his shirt on and nobody understands. In clothes I looked normal, so what exactly was I hiding? I had no answer people would accept. So I stayed home.

That's why the "before" photo of me isn't a picture. It's the absence of one. I made sure no camera ever caught me without a shirt. If you've ever dodged a camera, worn layers in the heat, or made an excuse to skip the pool, you already know exactly what I looked like. You look like that in your own head right now.

That's why I wrote this.

How Bad Was It, Actually?

Let me give you the real number, because I've done the math.

Today I'm 28 years old, 135 pounds, at 14% body fat. That means I carry about 116 pounds of lean mass and about 19 pounds of fat.

At 22, I weighed 185 pounds. Back then I had at least 10 pounds less muscle than I have now, so my lean mass was around 106 pounds at most. Do the subtraction: that leaves roughly 79 pounds of pure fat on my body.

That's about 43% body fat.

For a man, healthy is 10 to 20%. Obesity starts at 25%. I was carrying nearly double the obesity threshold, at 22 years old, while looking "normal" in a sweater. Nearly half of my body weight was fat. That's the trap of skinny fat: the mirror in clothes says you're fine while your body composition says you're in serious metabolic danger.

The Wake Up Call

At 22, I had an accident. I won't dress it up. It did what accidents do. It made me realize nobody was coming to fix my life. If I wanted the body I'd been wishing for since I was a kid, I had to take control and work for it.

So I did. Sort of.

Four Years of Doing It Wrong

Years 1 and 2: I threw myself into calisthenics. I ate high protein, or at least I think I did, because I never tracked anything. I lost 20 pounds from 185. Then I'd yo yo it back.

Years 3 and 4: I stopped going to the gym and just ate carefully. Kind of. I lost another 10 pounds over those two years. Still yo ying. Still not tracking. Still not walking.

Here's what the yo ying really was. It came directly from being skinny fat. Some days I'd look at my arms, feel too weak and skinny, and increase my calories to build muscle. Then I'd catch my stomach in the mirror, feel too fat, and cut my calories back down. Up and down, over and over, because I never knew which problem to fix. Too skinny to bulk. Too fat to feel good shirtless. Chasing both goals at once and reaching neither.

Four years. Thirty pounds. I still looked soft, and people commented on it.

If you're there right now, I need you to hear this: it wasn't a willpower problem. I worked hard for four years. I was just working blind.

The Sentence That Changed Everything

Then I found Brandon Carter, and one line hit me like a brick:

"If you ain't tracking, you slacking."

He preached two things: you can't out train a bad diet, and get lean first, then build muscle. I finally listened.

Here's the math that made it real for me. I'm a recovering chocolate chip cookie addict. One cookie takes about **10,000 steps** to burn off. At my peak, I'd eat a whole 12 pack. That's **120,000 steps**. There aren't enough hours in a day to walk that off. You cannot out walk a cookie habit. You can't out train any of it. The only lever that works is knowing your numbers.

90 Days vs. 2 Years

So I locked in. I tracked every calorie. I tracked my steps. Even on days I overate, and I did overeat, I knew I overate, by exactly how much, and I could adjust.

The result: **I lost 10 pounds in 90 days.**

The same 10 pounds that had previously taken me two whole years.

Same body. Same genetics. Same cookies calling my name. The only difference was tracking.

Today there are pictures. I take my shirt off whenever I want. The kid who wore sweaters in the summer would not believe it.

This photo exists now. For 24 years, none did.

Same week. In clothes you can't tell anything. That's the skinny fat trap, and it cuts both ways.

Why I'm Telling You This

Because your 20s are your prime. These are the years your body recovers fastest, builds muscle easiest, and burns fat best. These are the years of beaches, pools, and photos you'll look back on forever.

I spent the first part of my prime hiding under sweaters. You don't have to. I already wasted the four years of guessing so you can skip straight to what works.

These pants fit a much bigger man once.

What This Book Is

This is the program I wish someone had handed me at 22. Not four years of guessing. The straight line:

1. **Calories.** The whole game. This is the secret, and I'll prove it to you.
2. **Steps.** Your daily fat burning floor.
3. **The gym.** A simple program so you keep muscle and look lean, not just smaller.

In the next chapter, we're going to run your numbers: where you are, where you want to be, and exactly how many days it will take to get there, as fast as your body biologically allows.

No guessing. Not anymore.

Let's go.

Chapter 2: Your Numbers

You can't hit a target you never aimed at. That was my mistake for four years. So before you change a single meal, we're going to spend ten minutes with a calculator and get you four numbers:

1. Where you are
2. Where you're going
3. Your personal maximum speed
4. Your exact timeline

Grab a pen. This chapter is a worksheet. Fill it in as you read.

Step 1: Where You Are

Your weight: Step on a scale first thing in the morning, after the bathroom, before food or water. Write it down.

Current weight: _____ lbs

Your body fat percentage: You don't need a fancy scan. Estimate it visually using the chart on the next page: find your row, be honest.

WHERE ARE YOU RIGHT NOW?

Look in the mirror shirtless. Find your row. Be honest.

10 to 14%

LEAN

Abs clearly visible. Veins may show on arms.
Face looks sharp. Shirt comes off without a thought.

15 to 19%

ATHLETIC

Faint ab outline with some softness over it.
Lean in clothes. Looks fit at the beach.

THE GOAL: 15%

20 to 24%

SOFT

No abs visible. Some belly when sitting.
Looks fine in clothes. This is skinny fat territory.

25 to 30%

OVERWEIGHT

Clear belly. Soft chest. Waistband folds over.
25% is the medical line where obesity starts for men.

31 to 40%+

HIGH RISK

Large belly. Fat on chest and back.
Health risk rises sharply here. Start today.

WHEN IN DOUBT, PICK THE HIGHER NUMBER.

Honesty here means accuracy everywhere else in your plan.

Here are the ranges in words. Look at yourself shirtless in the mirror and compare honestly:

- Abs clearly visible: 10 to 14%
- Faint ab outline, some softness: 15 to 19%
- No abs visible, some belly: 20 to 24%
- Clear belly, soft chest: 25 to 30%
- Large belly, fat on chest and back: 31 to 40%+

When in doubt, pick the higher number. Honesty here means accuracy everywhere else.

Body fat: _____ %

Now split your body into its two parts:

Fat mass = weight $\times$ body fat % = _____ lbs of fat Lean mass = weight minus fat mass = _____ lbs of lean

Example: Mike weighs 190 at 28% body fat. Fat mass: $190 \times 0.28 = 53$ lbs of fat. Lean mass: $190 \text{ minus } 53 = 137$ lbs.

Step 2: Where You're Going

Pick your goal weight. **Not sure what to aim for? Your goal is 15% body fat.** At 15% you look lean in clothes, you see ab definition, your health markers improve dramatically, and it's the ideal launch point for building muscle afterward. It's the sweet spot of looking great and living normally.

Here's the shortcut to turn that into a goal weight: your lean mass barely changes during a proper cut, so your weight at 15% body fat is roughly your lean mass $\div 0.85$.

Mike: $137 \div 0.85 = 161$ lbs. So Mike sets his goal at 161.

Goal weight: _____ lbs Pounds to lose: current minus goal = _____ lbs

Step 3: Your Maintenance Calories

This is how much your body burns per day right now. A reliable estimate for someone following this program (lifting and walking daily):

Maintenance = current weight $\times 15$

Mike: $190 \times 15 = 2,850$ calories per day.

Your maintenance: _____ calories

Step 4: Your Personal Maximum Speed

Here's the number almost no program gives you. Your body can only pull so much energy out of stored fat per day. The research puts the ceiling at about **31 calories per pound of body fat you carry, per day**. Try to cut faster than that and the extra loss starts coming from muscle. You'd be burning the engine to save on fuel.

Your max deficit = $31 \times$ your fat mass

Mike: $31 \times 53 = 1,643$ calories per day. That's Mike's biological speed limit.

Your max deficit: _____ calories

Now the floor. No matter what the formula says, your daily food intake never goes below 1,500 calories for men or 1,200 for women. Below that, you lose muscle, energy, and your ability to stick with this. Check it:

Maintenance minus max deficit = _____ calories eaten per day

If that number lands under your floor, shrink your deficit until eating lands at the floor. Mike: 2,850 minus 1,643 = 1,207. That's under the 1,500 floor, so Mike caps his deficit at 1,350 and eats 1,500 a day at full speed.

Step 5: Pick Your Speed

Your deficit lives between two ends:

The patient end: 500 per day. About a pound a week. You'll barely feel it. More food, more energy, easier social life, maximum muscle kept. If your timeline is flexible, this is the smart play.

The full send: your personal max. This is what I did. My numbers allow a 1,500 daily deficit, and I used every bit of it because I was done being the guy in the sweater. It works. I'll also tell you straight: it demands real discipline, and tracking is what makes it survivable.

Or anything in between. This is your call, and it's a math decision, not a willpower decision. Pick the timeline you want, then check it against your max.

My deficit: _____ calories per day My daily intake: maintenance minus deficit = _____ calories per day

Step 6: Your Exact Timeline

One pound of fat holds about 3,500 calories. So:

Days to goal = (pounds to lose × 3,500) ÷ daily deficit

Mike wants to lose 29 lbs at a 1,350 deficit: $(29 \times 3,500) \div 1,350 = 75$ days. Two and a half months to a body Mike has never had in his life.

Run yours:

(_____ lbs × 3,500) ÷ _____ deficit = _____ days

Circle that number. Put a date on your calendar. That's the day you meet the version of you that this program builds.

The Fine Print That Makes This Real

Your maintenance estimate isn't perfect, and it doesn't need to be. In Chapter 6 you'll weigh in daily and compare your weekly average against this math. If the scale moves slower than predicted, your maintenance was lower than estimated and we adjust. The tracking system self corrects. That's the entire reason tracking beats guessing.

Next up: the secret itself. How to actually track calories without losing your mind.

Chapter 3: Tracking. The Whole Game.

If you ain't tracking, you slacking.

Everything else in this book supports this chapter. Fat loss is calories in versus calories out. Full stop. Your body doesn't know what a "healthy food" is. It knows energy. Eat less energy than you burn and fat comes off. Eat more and it goes on. Chapter 2 gave you your daily calorie number. This chapter is how you hit it every single day without losing your mind.

The Two Tools You Must Own

Before anything else, get these. They're non negotiable and together they cost less than this book times two:

A food scale. Digital, measures in grams. This is the single most important purchase of your fat loss. Eyeballing portions is how I stayed fat for four years. A "tablespoon" of peanut butter eyeballed is usually two or three. That's 200 extra untracked calories from one scoop. The scale ends the guessing.

A body scale. You'll weigh yourself every morning. That daily number is how we verify the math is working (full system in Chapter 6).

No scale, no program. Order both today.

Pick Your Tracker

The app matters way less than people think. Two easy options:

MyFitnessPal. The classic. Huge food database, barcode scanner, free tier does everything you need.

An AI assistant. Tell it what you ate with the weights from your food scale, and it totals your calories and protein and keeps a running log. You can even send it a photo of a nutrition label. This is the lazy man's tracker, and lazy that works beats perfect that doesn't.

Pick one today. The best tracker is the one you'll actually open.

Your Protein Line

While calories decide fat loss, protein decides what the loss is made of. Hit roughly **0.8 to 1 gram per pound of your goal weight** daily and your body pulls from fat while keeping your muscle. Skip it and you lose muscle along with the fat, and you end up a smaller version of

skinny fat. Calories first, protein second, everything else is filler.

Make Tracking Stupid Easy

Here's the secret inside the secret. The people who succeed at tracking aren't more disciplined. They just made tracking easier. Three moves:

1. Eat the same things every day. This is the biggest cheat code in the game. Track your breakfast once, and every breakfast after that is one tap. Same lunch, same rotation of dinners. You stop making food decisions and food decisions are where diets die. Boring? Maybe. You know what else is boring? Four years of yo yoing. Pick meals you like, lock them in, watch tracking take 90 seconds a day.

2. If you don't eat the same things, eat trackable things. Foods with labels. Foods with one ingredient (chicken breast, rice, eggs, potatoes, fruit). A meal you can weigh and look up beats a mystery casserole every time.

3. When eating out, chains beat restaurants. This sounds backwards, so hear me out. McDonald's publishes exact calories for every item. A Big Mac is 590 calories today, tomorrow, in every city. That sit down restaurant meal? The chef doesn't measure the butter, the oil, or the sauce, and neither can you. Restaurant meals routinely run 400 to 800 calories over what you'd guess. On this program, a tracked McDonald's order is a better fat loss meal than an untracked "healthy" restaurant salad. Track beats guess, always.

The Mistakes That Keep People Fat While "Tracking"

These five leaks sink more cuts than anything else:

Cooking oil. One tablespoon is 120 calories. Pan fried anything usually carries two or three. Weigh your oil or use spray.

Sauces and dressings. Ranch, mayo, ketchup, that drizzle. They add up to hundreds of hidden calories. Weigh them or pick low calorie versions.

Drinks. Sodas, juices, that oat milk latte, alcohol. Liquid calories don't fill you up and they count 100%. Water, black coffee, tea, and diet sodas are your friends.

Bites and tastes. The fries off her plate. The handful of chips while cooking. If it goes in your mouth, it goes in the log.

Weekend amnesia. Tracking Monday through Friday and winging the weekend means you're untracked 30% of your life. The weekend counts double because that's when the damage happens.

Kill the Cheat Meal

You've heard of cheat meals. Forget the concept. Here's why it's broken: a cheat meal means your diet is a prison and cheating is the escape. That mindset is what creates the binge and restrict cycle that kept me yo ying for years.

On this program there's nothing to cheat on. If your deficit isn't ultra aggressive, you can fit nearly any food into your day. Cookies, pizza, a burger. Weigh it, log it, stay under your number, and it's not cheating. It's Tuesday. The moment every food is allowed as long as it's counted, the forbidden food loses its power over you.

And if you do blow past your number one day? Here's the biology that should kill your panic: your body can only store roughly a pound to a pound and a half of actual fat from even a massive day of overeating, and most of the scale jump you see the next morning is water and food weight that clears in days. One bad day recorded honestly is a speed bump. One bad day that turns into an untracked week is how you lose the whole game. Log it, move on, back to your number tomorrow.

I'll be straight with you: every two weeks, I sit down and eat big with zero guilt. The difference between that and a "cheat meal" is that it's planned, it's honest, and the other 13 days are locked in. Earn that level of control first by tracking everything for your first 60 days.

Your Daily Tracking Ritual

Morning: weigh yourself, log it (Chapter 6 tells you what to do with it). Every meal: weigh the food, log it before you eat it. Logging before eating turns the log into a decision instead of a confession. Evening: check your total. Under your number? Day won. Doesn't matter what the mirror says today, the math is undefeated.

Do this for 60 days and I guarantee the results. Literally. Chapter 7 has it in writing.

Next: the easiest fat loss weapon you're not using. Steps.

Chapter 4: Steps. Your Daily Burn Floor.

Calories out has two sides. The gym builds your body (next chapter). Steps quietly burn the fat, every day, without wrecking your joints or your motivation.

The Target: 10,000 Steps a Day

Let me be honest with you the way most programs won't: there's nothing magical about 10,000. It's just the general number everyone landed on, and it works. For most people it burns an extra 300 to 500 calories a day, it requires zero athletic ability, it doesn't leave you sore, and it doesn't make you hate your life the way forced running does. You can run if you love it. You never have to.

10,000 a day. Your phone or watch already counts them. That's the floor.

One Warning Before Anything Else

Walking more is not the solution to a bad diet. Remember the cookie math from Chapter 1: one cookie is 10,000 steps, and a 12 pack is 120,000. If your tracking is broken, no amount of walking saves you. Steps are a multiplier on a dialed diet. They multiply nothing when the diet is nothing. Calories first. Always.

The Best Version: The Incline Treadmill

Outside walking is great. Sunlight, fresh air, probably healthy in ways beyond calories. I'm not a doctor, I just look like I could charge you a copay.

For pure results per minute though, here's my setup: **treadmill at 15% incline, speed 2.0**. That combination roughly doubles the burn of flat walking while still feeling like walking. No impact, no gasping, no dreading it.

And here's why it became my daily habit: your hands and eyes are free. I read on that treadmill. I answer messages. I doom scroll. I watch entire movies. The time you already burn on your phone every day can burn fat at the same time. You're not finding time to exercise. You're relocating time you already spend.

One rule that's non negotiable: never hold the handles. The second you grab them, your legs stop carrying your weight up that incline. You lose most of the work, and the calorie number on the screen becomes fiction. Arms swing free, posture tall. If you need the handles to survive it,

lower the incline until you don't.

When You Overeat: Pay the Price

This system is honest, so let me be honest: I still struggle with overeating. Especially when people keep offering me food, or when a chocolate chip cookie is lingering around the house calling my name. That struggle didn't disappear when I got lean. What changed is that tracking my calories and my steps means I always know the price. And most of the time, when I look at a craving through its price tag, I realize it's not worth it. That's what keeps me locked in. Not willpower. The receipt.

Here's one day where I paid full price. Mid cut, I overate by exactly 800 calories, and I only know that number because I tracked every bite of the damage. That's the tracking difference right there: my mistake had a price tag instead of a mystery.

So I paid it. 800 calories at my burn rate meant an extra 16,000 steps. I walked them.

Two things happened. First, no snowball. The classic binge spiral is: overeat, feel like a failure, say "the week is ruined," keep bingeing until Monday. Paying the price the same day closed the account. Nothing to spiral about, back to normal the next morning.

Second, the walk itself taught me something no article ever did. Somewhere around step 12,000 you start doing the math: those cookies were 20 minutes of eating and three hours of walking. You paid for that food twice, once with money and once with your legs. The next time the craving showed up, my legs remembered. I didn't want to overeat the next day. Not because of willpower. Because I knew the price.

Use this tool honestly: it's a correction for the occasional slip, not a daily punishment ritual. If you're walking off overages every other day, the problem is your deficit is too aggressive. Go back to Chapter 2 and pick a calmer speed. The plan should be livable on your worst week.

Making 10K Automatic

The target sounds big until you stack it from pieces you already have. A 30 minute incline session is roughly 3,500 steps. Park far, take stairs, pace during phone calls, walk after dinner. Most people find 4,000 steps hiding in a normal day. One treadmill movie session covers the rest.

Steps logged daily, right next to your calories. Two numbers a day. That's the whole cardio program.

Next: the gym. Three days a week, one simple plan, so the weight you lose is fat and never muscle.

Chapter 5: The Gym. Keep the Muscle, Lose the Fat.

Quick truth about why you lift during a cut, because it's not the reason most people think.

The gym is a terrible fat burner. An hour of lifting burns maybe 200 to 300 calories. One cookie. That's not why you're here. You lift for one reason: **so the weight you lose is fat and never muscle**. Cut without lifting and your body happily eats muscle along with fat, and you end up a smaller version of skinny fat. Soft at a lower weight. Lift while cutting and your body holds onto the muscle, so what emerges as the fat comes off is the athletic build you've been picturing. Lifting is what makes 15% body fat look like 15% body fat.

Now here's some good news you've earned by reading this far. If you're skinny fat, you can actually BUILD muscle during this cut. Your body is holding untrained muscle potential and plenty of stored energy at the same time, so it can pull calories from your fat to build new muscle even while you eat in a deficit. It's less effective than a dedicated muscle building phase, obviously. It's still the only real benefit of being skinny fat, so take it. You may finish this cut lighter, leaner, AND more muscular than you started.

And keeping your muscle now means that when you finish the cut, you're in the perfect launch position to build more. Lean first, then muscle. Same order I followed.

The Program: Push, Pull, Legs

Three days a week. Around 45 to 60 minutes. Every muscle hit weekly. Simple enough that you can't mess it up, effective enough that you'll never need a different plan during this cut.

- **Push day** trains everything that pushes: chest, shoulders, triceps
- **Pull day** trains everything that pulls: back, biceps
- **Legs day** trains legs and core

Run them any three nonconsecutive days. Monday, Wednesday, Friday is the classic. Machines are listed as full alternatives everywhere, so if the free weight version intimidates you, the machine builds the same muscle.

A warning before you touch a weight: going too heavy is how people get hurt. You do not need maximum weight to build muscle, and an injury will cost you months of progress to save a few weeks of it. What builds muscle is effort with control: pick a weight you can handle with clean form and take your sets close to struggle. The last two or three reps of a set should be hard. That's the target. Struggling with a controlled weight builds you. Struggling with a weight that

controls YOU breaks you. Ego adds weight to the bar, form adds muscle to your body.

Push Day

1. **Bench press** (barbell, dumbbell, or chest press machine): 3 sets of 6 to 10
2. **Seated shoulder press** (dumbbell or machine): 3 sets of 8 to 12
3. **Incline dumbbell press** (or incline machine): 3 sets of 8 to 12
4. **Lateral raises** (dumbbell or cable): 3 sets of 12 to 15
5. **Triceps pushdown** (cable): 3 sets of 10 to 15

Pull Day

1. **Lat pulldown** (or assisted pull ups): 3 sets of 6 to 10
2. **Seated cable row** (or machine row): 3 sets of 8 to 12
3. **One arm dumbbell row**: 3 sets of 8 to 12 per side
4. **Rear delt fly** (machine or dumbbell): 3 sets of 12 to 15
5. **Biceps curls** (dumbbell or cable): 3 sets of 10 to 15

Legs Day

1. **Squat** (barbell, goblet, or leg press): 3 sets of 6 to 10
2. **Romanian deadlift** (dumbbell or barbell): 3 sets of 8 to 12
3. **Leg extension**: 3 sets of 10 to 15
4. **Lying or seated leg curl**: 3 sets of 10 to 15
5. **Standing calf raises**: 3 sets of 12 to 15
6. **Plank**: 3 rounds, hold as long as you can with a straight line

Too Nervous to Walk In? I Was Too.

Real talk: I struggled with feeling too nervous to go to the gym. Everyone in there seemed to know what they were doing, and I was sure they'd all be watching the skinny fat guy fumble with the machines. If that's you, two things.

First, nobody is watching you. Everyone in that gym is staring at themselves in the mirror or at their phone between sets. The judgment you're afraid of exists only in your head. I know because I was certain of it too, and it was never real.

Second, if the nerves still win, start with bodyweight at home. Push ups, squats, lunges, planks, rows under a sturdy table. That's how I started my first two years. It absolutely builds muscle, and it builds the confidence to walk into the gym later. The gym is the optimal endgame for one

reason: progress tracking. A push up is hard to measure. A bar with numbers on it turns every workout into a score you can beat, and beating your score is the engine of this whole program. Start where your nerves allow, aim yourself at the gym.

The Only Three Rules

Rule 1: Progress or it doesn't count. Each exercise has a rep range. Start with a weight where you can hit the bottom of the range with good form. Every workout, try to add a rep. When you hit the top of the range on all three sets, add the smallest weight jump available and start again at the bottom. That's progressive overload, and it's the entire science of building strength in one paragraph.

Rule 2: Rest enough to actually lift. Two to three minutes after the big lifts (bench, squat, rows, pulldowns), 60 to 90 seconds after the small ones. Rushing rest doesn't burn meaningful calories, it just makes your next set weaker. The treadmill handles cardio. The gym handles muscle. Don't mix the jobs.

Rule 3: Log every workout. Same principle as food. Weight and reps for every set, in your phone or on the printable sheet at the end of this chapter. Next session, look at last session's numbers and beat one of them. If you ain't tracking, you slacking applies to the bar too.

What to Expect While Cutting

Set your expectations now so nothing surprises you: in a calorie deficit, you're not going to set powerlifting records. Early on, especially if you're new to lifting, your strength will climb anyway. Deeper into an aggressive cut, some lifts will stall. **On a cut, maintaining your strength IS winning.** The scale dropping while your lifts hold steady means everything you're losing is fat. That's the exact outcome this whole book is built for.

Miss a workout? Just hit the next one. Three days has enough slack in it that life can happen. Zero days for two weeks is the only real failure.

Your Week at Full Speed

Here's the whole physical program on one line: **lift three days, hit 10,000 steps every day, stay under your calorie number.** A person who does those three things for 60 days does not keep their old body. It's not possible.

One more excuse to kill before it forms: "I don't have time." Three hours a week is under 2% of your waking life, and Chapter 4 already showed you the steps happen during time you currently give to your phone. And if you're somehow the busiest person in the world? Drop and do push ups. At home, in your bedroom, three times a week. No commute, no membership, no excuse left.

And remember the hierarchy one final time: even if you never exercised at all, tracking your calories alone would still make you lose weight. The math doesn't need the gym's permission. The gym just decides whether the body under the fat is one you'll want to show off.

Next: the weekly system that proves it's working and tells you exactly what to adjust when the scale gets stubborn.

PRINTABLE WORKOUT LOG

Print one per week. Weight x reps for every set. Beat one number from last week.

PUSH DAY	Set 1	Set 2	Set 3
Bench press			
Seated shoulder press			
Incline dumbbell press			
Lateral raises			
Triceps pushdown			

PULL DAY	Set 1	Set 2	Set 3
Lat pulldown			
Seated cable row			
One arm dumbbell row			
Rear delt fly			
Biceps curls			

LEGS DAY	Set 1	Set 2	Set 3
Squat / leg press			
Romanian deadlift			
Leg extension			
Leg curl			
Calf raises			
Plank (time)			

Chapter 6: The Weekly System. Proof It's Working.

You've got your numbers, your tracker, your steps, and your program. This chapter is the control tower: the simple weekly routine that proves the plan is working and tells you exactly what to adjust when it isn't. Ten minutes a week. No guessing, ever again.

Rule 1: Weigh Every Morning, Trust Only the Weekly Average

Every morning: wake up, bathroom, then scale, before any food or water. Same scale, same spot on the floor. Log the number next to your calories and steps.

Now the part that saves your sanity: **a single day's weight means nothing.** Your weight swings 2 to 5 pounds day to day from water, salt, carbs, and what's sitting in your gut. None of that swing is fat. People quit great programs every week because Tuesday's number jumped from a salty dinner.

So we never judge a day. Every 7 days, add up the week's weigh ins, divide by 7, and compare that average to last week's average. The average filters out the water noise and shows you the fat truth.

Rule 2: Know What the Average Should Do

Go back to your Chapter 2 worksheet. Your daily deficit $\div 500$ = your predicted loss per week in pounds. A 500 deficit predicts about 1 pound a week. A 1,000 deficit predicts about 2. Compare your weekly averages against that prediction.

Week 1 warning: your first week will probably show a BIG drop, sometimes 3 to 6 pounds. Enjoy it, and know that most of it is water and gut content clearing out as you eat less. That's normal. It's also why week 2 can look slow. The real fat rate reveals itself from week 2 onward.

Rule 3: The Stall Protocol

Here's the entire adjustment system:

If your weekly average dropped: it's working. Change nothing. Keep going.

If your weekly average stalled for ONE week: do nothing yet. One flat week happens, usually water hiding a real fat loss. Stay the course.

If your weekly average has stalled for TWO straight weeks: your maintenance estimate was a little high, or it dropped as you got lighter (it does). Pick ONE lever: eat 200 fewer calories per day, or add 2,000 daily steps. Not both. Run the new setting for two weeks and reassess.

Never slash calories in frustration. The math only needs a nudge, and your Chapter 2 floor (1,500 men, 1,200 women) still applies no matter what.

That's it. That's the whole system. Drop = continue. One flat week = continue. Two flat weeks = one small lever. This loop cannot fail to find your fat loss rate, because it self corrects until the scale moves.

The 60 Day Proof Habit: Track It AND Shoot It

For your first 60 days, you're going to do two things with every single thing you eat:

1. **Log it** (calories and protein, as Chapter 3 taught you)
2. **Take a photo of it** before you eat. Every meal, every snack, every drink that isn't water. Ten seconds per meal.

Why both? Two reasons, and they're both for your benefit:

A) The camera guarantees your results. Photographing your food is the single strongest honesty device that exists. You can fudge a log entry at 10pm from memory. You can't fudge a photo you didn't take. The moment every bite requires a photo, the "bites and tastes" leak from Chapter 3 dies on its own, because you'll skip the handful of chips just to skip the photo. People who photograph everything they eat lose more fat on the same plan. The lens keeps you locked in when nobody's watching.

B) It's your ticket to the double your money back guarantee. Here's my deal with you, in plain terms: follow this program for 60 days and lose 10 pounds, or I pay you back TWICE what you paid for this book. Your food log plus your daily food photos plus your morning weigh ins ARE the proof that you followed it. No photos, no log, no claim. Full terms in the next chapter.

Read that again and understand what it means: the only way to lose money on this book is to follow it with a camera in your hand and not lose 10 pounds. And if you follow it with a camera in your hand, you're going to lose the 10 pounds. That's not a loophole. That's the point.

Your Printable Weekly Sheet

Print one per week. Stick it on the fridge. Fill it in every morning and evening.

WEEK # _____ **| Deficit:** _____ **cal/day | Intake target:** _____ **cal | Protein target:** _____ **g**

Mon	_____	_____	_____	_____	Y / N	Push / Pull / Legs / Rest
Tue	_____	_____	_____	_____	Y / N	Push / Pull / Legs / Rest
Wed	_____	_____	_____	_____	Y / N	Push / Pull / Legs / Rest
Thu	_____	_____	_____	_____	Y / N	Push / Pull / Legs / Rest
Fri	_____	_____	_____	_____	Y / N	Push / Pull / Legs / Rest
Sat	_____	_____	_____	_____	Y / N	Push / Pull / Legs / Rest
Sun	_____	_____	_____	_____	Y / N	Push / Pull / Legs / Rest

This week's average weight: _____ (add the 7 weigh ins, divide by 7)

Last week's average: _____

Change: _____

Decision this week (circle one): DROPPED → change nothing | FLAT 1 WEEK → change nothing | FLAT 2 WEEKS → minus 200 cal OR plus 2,000 steps

Next chapter: the guarantee, in writing.

Chapter 7: The Guarantee. In Writing.

I'm not asking you to believe me. I'm asking you to follow the program with a camera in your hand and let the scale settle it. Here's my end of the deal.

The Promise

Follow this program for 60 days. If you don't lose at least 10 pounds, I'll pay you back DOUBLE what you paid for this book.

I can make this offer loudly for one reason: the program's proof requirements and its success requirements are the same actions. If you do the things that make you eligible, the 10 pounds come off. The guarantee isn't a safety net under the program. It IS the program.

What "Following the Program" Means

To be eligible for the 2X guarantee, all six of these, for all 60 days:

- 1. Register your start.** Within 7 days of purchase, send your Day 1 email to ksiguineau@gmail.com with: your completed Chapter 2 worksheet, a photo of your morning weigh in (feet and scale reading visible), and your chosen daily calorie number. Your 60 days start on the date of that email.
- 2. Log every day of food.** A daily calorie total in your tracker, all 60 days.
- 3. Photograph everything you eat.** Every meal, every snack, every drink that isn't water, before you eat it. This is the backbone of the proof and the backbone of your results. They're the same thing.
- 4. Weigh in every morning.** Logged daily. Plus a scale photo on Day 1, Day 30, and Day 60.
- 5. Hit your steps.** 10,000 a day logged, from your phone or watch. Miss a day here and there? Life happens. Your 60 day average needs to sit at 10,000 or above.
- 6. Do the workouts.** Three sessions a week, logged (gym program from Chapter 5 or the bodyweight version). At least 22 total sessions across the 60 days.

Your calorie target must follow Chapter 2's rules, including the intake floor. A deficit of at least 500 calories a day is required to make the math capable of 10 pounds.

How to Claim

If you did all six and the scale shows less than 10 pounds lost between Day 1 and Day 60: email your proof bundle (food logs, food photos, weigh in log, the three scale photos, step history, workout log) to ksiguineau@gmail.com within 14 days of your Day 60. I'll review it, and if it checks out, you get double your purchase price back. One claim per customer.

No bundle, no claim. Partial bundle, no claim. I'm being strict about this for the same reason a gym can't refund you for workouts you didn't do: the guarantee covers the program, and the proof is the only way either of us knows the program is what ran.

The Real Fine Print

I want you to notice something about the list above. There's nothing in it about being perfect. You can have a rough day and photograph the damage. You can eat McDonald's. You can have the cookie, logged. The requirements are honesty and consistency, not perfection, because honesty and consistency are what burn fat.

The person who takes 1,800 photos of their food over 60 days has never once stayed fat. I'd bet double your money on it. In fact, I just did.

Before You Start

One piece of housekeeping: this book is education from my experience, not medical advice, and I'm not a doctor (Chapter 4 already confessed this). If you have a medical condition, take medications that affect weight or appetite, or haven't seen a doctor in years, get checked before you start. It's the adult move, and your results will only be better for it.

Now turn the page, run your Chapter 2 numbers, and send that Day 1 email.

Your 20s (or whatever decade you're in) are waiting. There are no before pictures of me. Make sure there are plenty of AFTER pictures of you.
